Entropy Vector Connecting Science And Business

The entropic vector or entropic function is a concept arising in information theory. It represents the possible values of Shannon's information entropy that subsets of one set of random variables may take. Understanding which vectors are entropic is a way to represent all possible inequalities between entropies of various subsets.

Entropic vector - Wikipedia

Entropy is a measurement that we have spent some time discussing above, particularly as a means of measuring the goodness of fit of a model. Entropy as a tool for use in information science and knowledge generation originated with Claude Shannon and his groundbreaking work on information theory in communications [Shan48]. Entropy is related to the maximum amount of information that can be conveyed by a certain number of bits.

The term describes the random information collected by an operating system to generate cryptographic keys used to encrypt information. As entropy increases, both in quality and quantity, keys become more difficult to decipher, and encryption improves. Traditional computer systems can generate inventories of the physical world by tracking users' movement with the mouse, for example, providing all the entropy needed to develop complicated cryptographic keys.
