A Unix shell is a command-line interpreter or shell that provides a command line user interface for Unix-like operating systems. The shell is both an interactive command language and a scripting language, and is used by the operating system to control the execution of the system using shell scripts. Users typically interact with a Unix shell using a terminal emulator; however, direct operation via serial hardware connections or Secure Shell are common for server systems. All Unix shells provide

UNIX Shell is a collection of computer operating systems that allow multiple users to do multiple tasks. A shell is a medium provided to interact with the kernel which is a Command Line Interface (CLI) to the Unix system. It is basically a command-line interface to the Unix system. It works by gathering the input from the users, executing the program based on the input from the users and then displaying the output after the execution of the program.

Bash is a Unix shell and command language written by Brian Fox for the GNU Project as a free software replacement for the Bourne shell. First released in 1989, it has been used as the default login shell for most Linux distributions and all releases of Apple's macOS prior to macOS Catalina. A version is also available for Windows 10 via the Windows Subsystem for Linux. It is also the default user shell in Solaris 11. Bash is a command processor that typically runs in a text window where the user
