The goal of this work is to present the principles of functional analysis in a clear and concise way. The first three chapters of Functional Analysis: Fundamentals and Applications describe the general notions of distance, integral and norm, as well as their relations. The three chapters that follow

deal with fundamental
examples: Lebesgue
spaces, dual spaces
and Sobolev spaces.

Two subsequent
chapters develop
applications to
capacity theory and
elliptic problems. In
particular, the

The epilogue contains a sketch of the history of functional analysis, in relation with integration and differentiation.
